

HW 2.3

1. What is required in both attribute tables (spreadsheets) in order to perform a "Field Join"?

The shared column should be present in both attribute tables in order to perform a "field join" so that the output layer can match values using that column as an anchor.

2. What method should be used if two layers can be visualized (rendered/drawn) as a **"Feature layer"** but their attribute tables are unique.

The 'use spatial relationship' method should be used if two layers can be visualized as a "feature layer" but their attribute tables are unique.
