HW 7

**Dashboard Impressions**:

#1 - [Redlining and Exposure to Urban Heat Islands](#)

#2 - [California Power Outage Dashboard](#)

#3 - [Global Active Fires and Hotspots](#)

In #1, the elements were overall well organized with adequate spacing and not an excess amount of information. The right sidebar made it easy to locate and click on cities and the fluid panning animations made navigation appealing to the eyes. In #2, the dashboard has a surplus of information including specific dates and times, descriptions, sources, and log reports from power companies such as PG&E. The color palette is very appealing and easy to read against the dark background. #3's dashboard provides a very simple graph and counter for active global fires and its simplicity allows the map to take the highlight of the dashboard, allowing the user to pan to specific areas and locate fires in a specific area. The active hotspots counter also updates with the current region shown on the map, so it is useful for gauging the number of active fires in a specified area.
